From scattered events to lasting participation.

Knot connects discovery, eligibility, registration, event operations and community return—without turning unknowns into favourable claims.

01 · DISCOVERY FAILURE

Events are fragmented

Platforms, websites, posters and forwarded messages lack one trustworthy participation record.

02 · PARTICIPATION FAILURE

“Can I join?” is hard

Age, eligibility, location, cost, schedule and team rules are difficult to evaluate together.

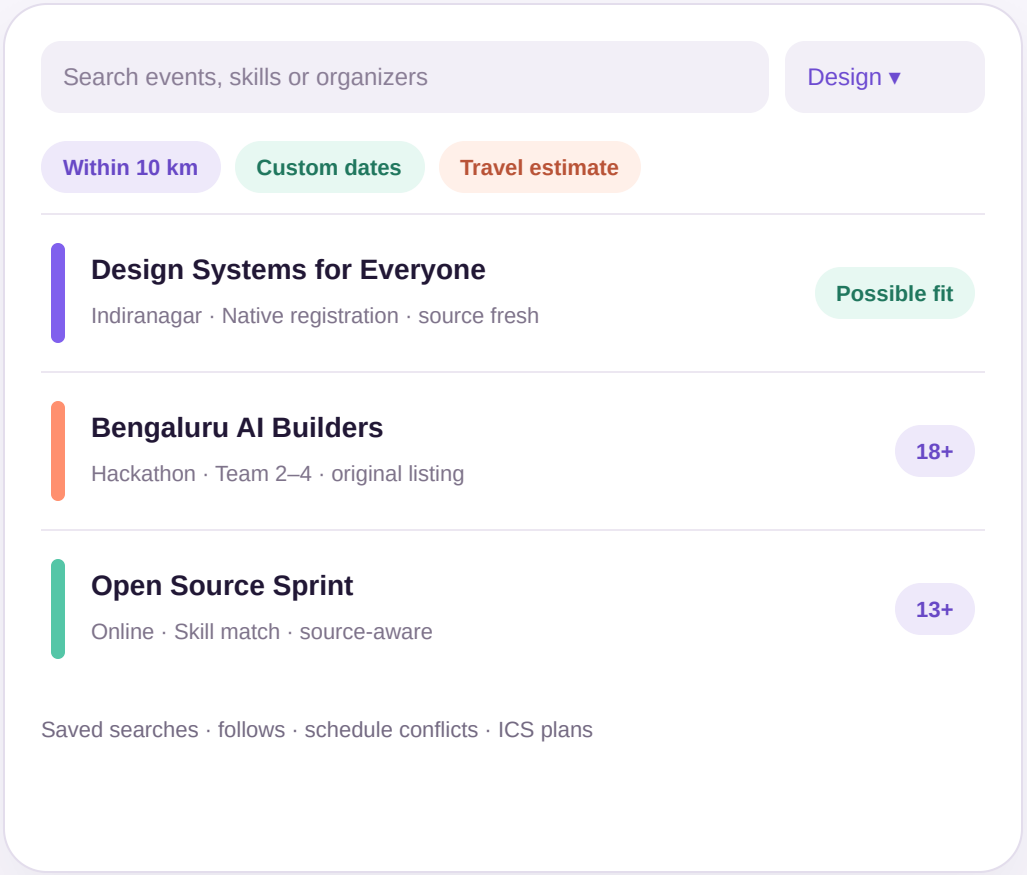

03 · RETURN FAILURE

Organizers lose the thread

Registration is only the start: communication, operations and the next event need the same context.

Discovery that explains itself.

Hyperlocal and online filters meet canonical source records, conservative extraction and mandatory review.

01 **Pasted text · public URL · local poster OCR**

02 **Private original evidence**

03 **Structured fields + confidence + duplicates**

04 **Human review · merge · source permission**

05 **Canonical event + preserved original listings**

Honesty rule: unknown price is not Free, a source URL is not a title, OCR is not auto-publication, and an external click is not a registration.

40 geocoded Bengaluru localities · reviewed JSON federation boundary

Public browsing requires no account

Real states. Restrictive safeguards.

Authentication and event rules come before participation—not after a click is mistaken for success.

NATIVE + EXTERNAL

One plan, distinct evidence

External page opened	handoff only
External registration self-confirmed	self-report
Pending → approved / waitlisted	not confirmed yet
QR check-in → attended	organizer record

Capacity, custom private questions, deterministic promotion, controlled joining links and attendance-based certificates.

13–17 · MINOR MODE

Every gate must pass

Age rule → Guardian consent → Organizer checklist

Explicit-only
No behaviour-derived interests or promotional profiling.

Private by default
No public going identity, badges or minor showcase.

Account control
Pending, active, withdrawn and deleted states.

Event safety
Four organizer declarations; never blanket verification.

Local boundary: guardian attestation demonstrates the workflow; production activation still requires verifiable consent, retention and safeguarding review.

One studio. The whole participation loop.

FULL EVENT OPERATIONS

Bengaluru AI Builders Hackathon

One audited canonical record powers every participant-facing view.

Private registration
Custom questions · approval · waitlists

Event content
FAQs · resources · rounds · agenda

Projects & judging
Submissions · rubrics · feedback

People & access
Co-organizer · judge · volunteer

Material changes
Confirm · revise · audit · notify

Delivery ledger
Preview · opt-out · schedule · quiet hours

Before

Reach estimates with small-group suppression. Saved searches, follows and readiness context.

During

QR check-in, attendee Q&A, resources, announcements and issue reporting.

After

Projects, feedback, certificates, recaps, series and the next relevant event.

Built to be trusted—and tested.

A fresh implementation with connected workflows, real input adapters and explicit production boundaries.

DELIVERED

- ✓ **Optimized application:** TypeScript build, 2,113 modules, lazy routes and no chunk-size warning.
- ✓ **Real adapter tests:** generated QR decoding and local Tesseract OCR—not mocked outputs.
- ✓ **Responsive workflows:** multi-account, minor, organizer, trust, federation and 390 px mobile paths.
- ✓ **Delivery bundle:** source, documentation, exactly-five-slide PDF and 120-second MP4.

HONEST BOUNDARY

- Browser-local repository; no production cloud or multi-device sync.
- No live platform connector or internet-scale crawl is claimed.
- Local guardian attestation is not production-verified consent.
- No email/SMS/WhatsApp delivery or proof of reading.
- Paid ticketing, live video, WhatsApp automation and dependent profiles remain separately gated.
